WPI; 2003-029926/02. N-PSDB; ACA38563.

New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

Claim 25; SEQ ID NO 62617; 1766pp; English.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the

The antisense nucleic acids required cc proliferation to isolate candidate molecules for rational creditied for proliferation to isolate candidate molecules for rational cc arguired for proliferation in cells other than S. aureus, S. typhimurium, cc for eclular prokaryotic essential genes. Note: The sequence data for this cc patent did not form part of the printed specification, but was obtained cc in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

```
New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to
isolate candidate molecules for rational drug discovery programs
```

Claim 25; SEQ ID NO 64571; 1766pp; English.

cc encoding a polypeptide whose expression is inhibited by the antisense cnucleic acid; (2) a host cell containing the vector; (3) an isolated copolypeptide or its fragment whose expression is inhibited by the activity of a gene in an operon required for the polypeptide; (6) producing the polypeptide; (6) inhibiting cellular coproliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway crequired for proliferation, or that inhibite cellular proliferation or the biological pathway in which a proliferation required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound a activity; (11) a culture comprising strains in which the gene product is overaxpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of solateration. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required correctly programs. or for screening homologous nucleic acids acids. drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this Sequence 1041 AA; patent did not form part of the printed spi in electronic format directly from WIPO at the 6213 antisense sequences given in the specification where of the nucleic acid inhibits proliferation of a cell. Also inc ftp.wipo.int/pub/published\_pct\_sequences (1) a vector comprising a promoter operably linked to the nucleic acid invention relates to an isolated nucleic acid specification, but comprising any one of Also included are:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a Mycobacterium tuberculosis protein. Products from the present invention, which describes protein fragments and nucleic acid fragments derived from M.tuberculosis, can be used in the detection of and prevention of mycobacterial infections. In particular, the proteins and nucleic acids can be used for the diagnosis of or vaccination against tuberculosis caused by M. tuberculosis, M.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated mycobacteria polypeptides and nucleic acids - used developing products for the diagnosis of or vaccination against mycobacterial infections, particularly tuberculosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC to the tuberculosis complex. The invention provides a (1) fusion of the comprising at least one polypeptide fragment (1) and at least cone fusion partner; (2) a fusion polypeptide fragment (2) and at least cone fusion partner; (2) a fusion polypeptide fragment comprising a T-cell cepitope from M. tuberculosis protein ESAT-6, or MPT59 and a second conferent amino acid sequence from M. tuberculosis, and/or including a conference which protects the first amino acid sequence from in vivo degradation or post-translational processing; (3) a nucleic acid fragment cut that encodes the above polypeptides. The polypeptides and mucleic acid concentration against TB caused by Mycobacterium tuberculosis, africanum or convisor. The polypeptides are also useful for diagnosis, africanum or convisor. The polypeptides are also useful for diagnosing ongoing or cut tuberculosis complex. The invention also describes the use of CPP7A or convisor. The invention also describes the use of CPP7A or convisor in a mammal in the induction of a strong immune convisor in a mammal by performing a DTH type skin convisor of for the preparation of an immunological composition; and convert the propagation of a subunit vaccine of convisor the preparation of a subunit vaccine converted to the preparation of a 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Best Loc

Mycobacterial strains are responsible for leprosy (M. leprae) and tuberculosis (M. tuberculosis). RSs's are mycobacterial enzyme that are generally responsible for the reaction: aaRS+aa+ATP => aaRSaa-AMP+PPI -AMP+CHNA => aa-CRNA+aaRS+ANP, where aa is an amino acid. IleRSs is the enzyme specific for Isoleucine, with each amino acid having its own specific enzyme. These enzymes are essential for protein production. As more and more mycobacteria become resistant to drugs and antibiotics, tester strains comprising host cells containing a recombinant mycobacterial isoleucyl-tRNA synthetase gene, can be used to rapidly assess the antimicrobial effect and specificity of isoleucyl-tRNA synthetase inhibitors. The recombinant enzymes are also useful for biochemical studies of the enzyme in elucidation of further treatment strategies. The cloning and recombinant production of the enzyme has not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA encoding mycobacterial isoleucyl-tRNA synthetase - and corresponding vectors, recombinant hosts and tester strains for recombinant production of the enzyme used in assays to identify inhibitors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Misc-difference

New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

Claim 25; SEQ ID NO 63826; 1766pp; English.

ABUSULT 7
ABUSSON 7
ABUSSO CC (1) a vector comprising a promoter operably linked to the nucleic acid (2) a host cell containing the vector; (3) an isolated color, polypeptide or its fragment whose expression is inhibited by the containing the vector; (3) an isolated color, containing the vector; (3) an isolated color, containing the vector; (3) an isolated color, containing the polypeptide; (5) producing the polypeptide; (6) inhibited by the continent of the polypeptide; (5) producing the polypeptide; (6) inhibited by the continent color, containing cellular color, containing cellular color, containing cellular proliferation of the gene product or that has an activity against a biological pathway of the gene required for cellular proliferation or the biological pathway in which hat test compound that inhibits gene product lies cor a gene on which the test compound that inhibits gene product lies cor agene on which the test compound that inhibits proliferation of an compound; sactivity; (11) a culture comprising strains in which the gene compound; sactivity; (11) a culture comprising strains in which the gene compound; sactivity; (11) a culture comprising strains in which the gene compound; overexpressed or underexpressed; (12) determining the extent compound; overexpressed or compound that inhibits the gene compound; overexpressed or sompound; that inhibits the gene compound; overexpressed or sompound; (12) determining the extent compound; overexpressed or sompound; (12) determining the extent compound; (13) identifying the target of a compound that inhibits the contained; or contained; or for screening for homologous nucleic acids required for goileration to isolate candidate molecules for rational contained; (12) determining the extent contained; (13) determining the extent contained; (14) profileration of contained; (15) determining the extent contained; (15) determining the extent contained; (15) determining the extent the 6213 antisense sequences given in the specification where expresof the nucleic acid inhibits proliferation of a cell. Also included invention relates to an isolated nucleic acid comprising any one expression are:

New antisense nucleic a for homologous nucleic isolate candidate molec molecules acids, useful for identifying proteins or scruc acids required for cellular proliferation to scrules for rational drug discovery programs.

Claim 25; SEQ ID NO 54011; 1766pp; English

The invention relates to an isolated nucleic acid comprising any one of CC the 6213 antisense sequences given in the specification where expression CC of the nucleic acid inhibits proliferation of a cell. Also included are: CC (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated CC polypeptide or its fragment whose expression is inhibited by the antisense cC antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (6) inhibited by the cC the polypeptide; (5) producing the polypeptide; (6) inhibited polypeptide; (7) identifying a compound that influences the activity of a green product or that has an activity against a biological pathway crequired for proliferation, or that inhibite cellular proliferation; (8) contentifying a gene required for cellular proliferation or the biological pathway in which a proliferation—required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this catent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           N
```

from

New nucleic acid encoding variant forms of proteins required genetic stability and proper protein folding, useful for procfine chemicals, specifically lysine, in microorganisms.

Claim 1; SEQ ID NO 76; 265pp; German

This invention describes novel polynucleotides and polypeptides involved in genetic stability (DNA repair and recombination, transposition of genetic material), gene expression and folding of proteins in

                                                                                                                                                                                                                                                                                                                                                                                                                             genetic scattery; with the production; gene expression; protein folding; fine chemical production; lysine production; nucleotide production; nucleotide production; nucleotide production; lipid production; diol production; carbohydrate production; aromatic compound production; vitamin production; co-factor production; food; animal feed; cosmetic; pharmaceutical.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office

The present invention describes a polynucleotide (I) comprising a sequence of a Bifidobacterium genome selected from the nucleotide sequences given in ABQ81842 and ABQ81843, or a sequence exhibiting at least 90% identity or which hybridises with the sequences given in ABQ81843. Also described is a polynucleotide (II) encoding fusion protein, comprising a sequence selected from 1097 sequences giver in ABPG6258 to ABBG6354 ligated in frame to a polynucleotide encoding a heterologous polypeptide. (I) has antidiarrheic and antibacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Corynebacterium glutamicum. Polynucleotides are isolated from a nucleic acid library of C. glutamicum then mutated at the specified positions, cloned and expressed by standard methods. Cells containing vectors that express the polynucleotides are used for production of fine chemicals, preferably amino acids and specifically lysine, but more generally nucleotides, nucleosides, lipids, fatty acids, diols, carbohydrates, aromatic compounds, vitamins, co-factors and enzymes. These are useful in the food, animal feed, cosmetics and pharmaceutical industries. The polynucleotides, optionally as primers and probes, can also be used for identification of metabolic activity. Cells that contain the polynucleotides of the invention may produce fine chemicals in better yields, with higher productivity and/or more efficiently.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antidiarrheic; antibacterial; inhibitor of Salmonella; detect identification; lactic acid bacterium; diarrhoea; pathogenic rotavirus; food composition; pharmaceutical composition.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        88888888888888888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC a probe) is useful for the detection and/or identification of CC Bifidobacterium longum in a biological sample. A carrier containing the CC lactic acid bacterium Bifidobacterium longum NCC2705 (CNCM I-2618) can be CC used for preventing and/or treating diarrhoea brought about by pathogenic CC bacteria and/or rotavirus. The carrier is a food composition selected CC from milk, yogurt, curd, cheese, fermented milks, milk based fermented CC products, ice-creams, fermented cereal based products, milk based CC powders, infant formula, pet food or a pharmaceutical composition CC selected from tablets, liquid bacterial suspensions, dried oral CC supplement, wet oral supplement, dry tube feeding or wet tube feeding. CC (I) is useful in DNA arrays or chips to carry out analysis of the CC expression of the Bifidobacterium gene. ABQ81844 to ABQ81850 represent CC Listing from the present invention but not mentioned further within the specification. N.B. The sequence data for this patent is not represented CC in the printed specification but is based on sequence information CC supplied by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

                                                                                맑
                                                                                                                       S
                                                                                                                                                                                                                                                                                                               I arbitrary region in the sequence, providing a vector that contains a CC sequence homologous with the selected region and a marker gene, cc transformation, and homologous recombination. The genome is preferably the genome of a hyperthermostable archaebacterium, particularly contemporate some in the genome of a for targeting the cc disruption of a gene in the genome of an organism, which is applicable in studying gene structure and functions as well as enzyme activities of encoded proteins and useful in medicine, forensic science, food or drug inspection, molecular biology and immunology. With this method, the cdisruption of a gene at an arbitrary position in a genome can be achieved efficiently and reliably. The present sequence is that of a protein concoded by the genome of Thermoscocus kodakaraensis which was derived using the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in which interestly from WIPO at

                                                                                                                                                                                                                                                                                                                                      nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (BLISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Propionibacterium acnes vaccinating against and treating acne vulgaris.
